SERVICE TRANSMISSION

Transmission Flush: Softens and removes normal contamination from the inside of the transmission. It is especially helpful in removing dirt that collects inside the torque converter. Reduced fluid flow causes the transmission to overheat leading to rapid wear of automatic transmission clutches and premature transmission failure. *Routine transmission flushing can double or triple the life of your automatic transmission.*

It is one of the most cost beneficial services you can perform.

\$20 OFF

SERVICE FUEL

Removes carbon and deposits from injectors, valves, and combustion chambers. Carbon deposits are the result of additives used in modern gasoline's to keep them stable and burnable. These necessary chemicals leach out and form substantial collections of carbon. Carbon depletion services are recommended for emissions failures, engine pinging problems, rough idle problems, hard starting, and hesitation problems and as general preventive maintenance.

\$20 OFF

POWER STEERING SERVICE

A relatively new process that helps prevent the failure of seals and gaskets inside the power steering pump and steering rack. In the past, power steering fluid was not a concern and typically lasted the life of the vehicle. Today, power steering fluid deteriorates much sooner due to significantly higher operating temperatures and pressures. Fluid deterioration can be credited with an estimated 300% increase in power steering repairs over the past fifteen years. Power steering flushing prevents most expensive power steering failures.

\$20 OFF

COOLANT SERVICE

Removes scale and contamination from inside the radiator and engine and maintains the proper coolant pH. Coolant pH is continually dropping and the lower the pH the more acidic and corrosive the coolant becomes.
