Foreword

In June 2011, Toyota released the 2012 Prius V gasoline-electric hybrid vehicle in North America. To educate and assist emergency responders in the safe handling of the Prius V hybrid technology, Toyota published this Prius V Emergency Response Guide.

The Prius V is based on the 3rd generation Toyota Prius. While many features from the Toyota Prius and Prius V are similar, emergency responders should recognize and understand the new, updated features of the Prius V covered in this guide.

High voltage electricity powers the electric motor, generator, air conditioning compressor and inverter/converter. All other automotive electrical devices such as the headlights, radio, and gauges are powered from a separate 12 Volt auxiliary battery. Numerous safeguards have been designed into the Prius V to help ensure the high voltage, approximately 201.6 Volt, Nickel Metal Hydride (NiMH) Hybrid Vehicle (HV) battery pack is kept safe and secure in an accident.

The Prius V utilizes the following electrical systems:
- Maximum 650 Volts AC
- Nominal 201.6 Volts DC
- Maximum 27 Volts AC
- Nominal 12 Volts DC

Prius V Features:
- A boost converter in the inverter/converter that boosts the available voltage to the electric motor to 650 Volts.
- A high voltage Hybrid Vehicle (HV) battery pack rated at 201.6 Volts.
- A high voltage motor driven Air Conditioning (A/C) compressor rated at 201.6 Volts.
- A body electrical system rated at 12 Volts, negative chassis ground.
- Supplemental Restraint System (SRS) - dual stage frontal airbags, a driver knee airbag, front seat side airbags, side curtain airbags and front seat belt pretensioners.
- An Electric Power Steering (EPS) assist motor rated at 27 Volts.

High voltage electrical safety remains an important factor in the emergency handling of the Prius V Hybrid Synergy Drive. It is important to recognize and understand the disabling procedures and warnings throughout the guide.

Additional topics in the guide include:
- Prius V identification.
- Major Hybrid Synergy Drive component locations and descriptions.
- Extrication, fire, recovery, and additional emergency response information.
- Roadside assistance information.

2012 Model Year Prius V

This guide is intended to assist emergency responders in the safe handling of a Prius V vehicle during an incident.

About the Prius V

The Prius V 5-door wagon joins the Prius, Camry Hybrid and Highlander Hybrid as a hybrid model for Toyota. Hybrid Synergy Drive means that the vehicle contains a gasoline engine and an electric motor for power. The two hybrid power sources are stored on board the vehicle:

1. Gasoline stored in the fuel tank for the gasoline engine.
2. Electricity stored in a high voltage Hybrid Vehicle (HV) battery pack for the electric motor.

The result of combining these two power sources is improved fuel economy and reduced emissions. The gasoline engine also powers an electric generator to charge the battery pack; unlike a pure all electric vehicle, the Prius V never needs to be charged from an external electric power source.

Depending on the driving conditions one or both sources are used to power the vehicle. The following illustration demonstrates how the Prius V operates in various driving modes.

1. During light acceleration at low speeds, the vehicle is powered by the electric motor. The gasoline engine is shut off.
2. During normal driving, the vehicle is powered mainly by the gasoline engine. The gasoline engine also powers the generator to charge the battery pack.
3. During full acceleration, such as climbing a hill, both the gasoline engine and the electric motor power the vehicle.
4. During deceleration, such as when braking, the vehicle regenerates kinetic energy from the front wheels to produce electricity that charges the battery pack.
5. While the vehicle is stopped, the gasoline engine and electric motor are off, however the vehicle remains on and operational.
**Prius V Identification**

In appearance, the 2012 model year Prius V is a 5-door wagon. Exterior, interior, and engine compartment illustrations are provided to assist in identification.

The alphanumeric 17 character Vehicle Identification Number (VIN) is provided in the front windshield cowl, passenger side floor and on the driver side B pillar.

Example VIN: **JTDZN3EU0C3000101**

A Prius V is identified by the first 8 alphanumeric characters **JTDZN3EU**.

---

**Exterior**

1. **PRIUSV** and **HYBRID** logos on the back door.
2. Logo on each front fender.
3. Gasoline fuel filler door located on driver side rear quarter panel.
Prius V Identification (Continued)

Interior

4 Instrument cluster (speedometer, READY indicator, shift state indicators, warning lights) located in center of the dash and near the base of the windshield.
Prius V Identification (Continued)

Engine Compartment

⑤ 1.8-liter aluminum alloy gasoline engine.
⑥ Logo on the plastic engine cover.

Hybrid Synergy Drive Component Locations & Descriptions (Continued)

Key Specifications:

- Gasoline Engine: 98 hp (73 kW), 1.8-liter Aluminum Alloy Engine
- Electric Motor: 80 hp (60 kW), Permanent Magnet Motor
- Transmission: Automatic Only (electrically controlled continuously variable transaxle)
- HV Battery: 201.6 Volt Sealed NiMH-Battery
- Curb Weight: 3,295 lbs/1,495 kg
- Fuel Tank: 11.9 gals/45.0 liters
- Fuel Economy Ratings: 44/50 (City/Hwy) miles/gal
  5.3/5.9 (City/Hwy) liters/100 km
- Frame Material: Steel Unibody
- Body Material: Steel Panels except for Aluminum Hood and Optional Polycarbonate Roof
- Seating Capacity: 5 passenger

Optional Polycarbonate Roof
Aluminum Hood
Steel Unibody
**Smart Key System**

The Prius V smart key system consists of a smart key transceiver that communicates bi-directionally, enabling the vehicle to recognize the smart key in proximity to the vehicle. Once recognized, the smart key will allow the user to lock and unlock the doors without pushing smart key buttons, and start the vehicle without inserting it into an ignition switch.

Smart key features:
- Passive (remote) function to lock/unlock the doors and start the vehicle.
- Wireless transmitter buttons to lock/unlock all 5 doors.
- Hidden metal cut key to lock/unlock the doors.

**Door (Lock/Unlock)**
There are several methods available to lock/unlock the doors.

- Pushing the smart key lock button will lock all doors. Pushing the smart key unlock button once unlocks the driver door, twice unlocks all doors.

- Touching the sensor on the backside of the driver door exterior handle, with the smart key in proximity to the vehicle, unlocks the driver door. Touching the sensor on the backside of the front passenger door exterior handle, with the smart key in proximity to the vehicle, unlocks all doors. Touching the lock touch sensor on either front door, or pushing the back door lock button will lock all doors.

- Inserting the hidden metal cut key in the driver door lock and turning clockwise once unlocks the driver door, twice unlocks all doors. To lock all doors turn the key counter clockwise once. Only the driver door contains an exterior door lock for the metal cut key.

Smart Key System (Continued)

Vehicle Starting/Stopping
The smart key has replaced the conventional metal cut key, and the power button with an integral status indicator light has replaced the ignition switch. The smart key only needs to be in proximity to the vehicle to allow the system to function.

- With the brake pedal released, the first push of the power button operates the accessory mode, the second push operates the ignition-on mode, and the third push turns the ignition off again.

Ignition Mode Sequence (brake pedal released):

- Starting the vehicle takes priority over all other ignition modes and is accomplished by depressing the brake pedal and pushing the power button once. To verify the vehicle has started, check that the power button status indicator light is off and the READY light is illuminated in the instrument cluster.

- If the internal smart key battery is dead, use the following method to start the vehicle.
  1. Touch the Toyota emblem side of the smart key to the power button.
  2. Within the 10 seconds after the buzzer sounds, push the power button with the brake pedal depressed (the READY light will illuminate).

- Once the vehicle has started and is on and operational (READY-ON), the vehicle is shut off by bringing the vehicle to a complete stop and then depressing the power button once.

- To shut off the vehicle before coming to a stop in an emergency, push and hold down the power button for more than 3 seconds. This procedure may be useful at an accident scene in which the READY indicator is on, park (P) cannot be selected, and the drive wheels remain in motion.
Electronic Shift Selector

The Prius V electronic shift selector is a momentary select shift-by-wire system that can be used to select reverse (R), neutral (N), drive (D), or engine brake (B) states.

- These states may only be selected while the vehicle is on and operational (READY-on), except for neutral (N) which may also be selected while in the ignition-on mode. After R, N, D, or B is selected, the transaxle remains in that state, identified on the instrument cluster, but the shift selector returns to the home position. To select neutral (N), it is necessary to hold the shift selector in the N position for approximately 0.5 seconds.

- Unlike a conventional vehicle, the electronic shift selector does not contain a park (P) position. Instead, a separate P switch located above the shift selector selects park (P).

- When the vehicle is stopped, regardless of shift state, the electro-mechanical parking lock pawl is engaged to lock the transaxle into park (P) by either pressing the P switch or pressing the power button to shut off the vehicle.

- Being electronic, the shift selector and park (P) systems depend on the low voltage 12 Volt auxiliary battery for power. If the 12 Volt auxiliary battery is discharged or disconnected, the vehicle cannot be started and cannot be shifted into or out of park (P). There is no manual override except to reconnect the auxiliary battery or jump start the vehicle, refer to Jump Starting on page 31.
Hybrid Synergy Drive Operation

Once the READY indicator is illuminated in the instrument cluster, the vehicle may be driven. However, the gasoline engine does not idle like a typical automobile and will start and stop automatically. It is important to recognize and understand the READY indicator provided in the instrument cluster. When lit, it informs the driver that the vehicle is on and operational even though the gasoline engine may be off and the engine compartment is silent.

Vehicle Operation
- With the Prius V, the gasoline engine may stop and start at any time while the READY indicator is on.
- Never assume that the vehicle is shut off just because the engine is off. Always look for the READY indicator status. The vehicle is shut off when the READY indicator is off.
- The vehicle may be powered by:
  1. The electric motor only.
  2. The gasoline engine only.
  3. A combination of both the electric motor and the gasoline engine.
- The vehicle computer determines how the vehicle operates in order to improve fuel economy and reduce emissions. Three features on the 2011 Prius V are EV (Electric Vehicle) mode, PWR (Power) mode and ECO (Economy) mode:
  1. EV Mode: When activated, and certain conditions have been met, the vehicle operates with the electric motor powered by the HV battery.
  2. ECO Mode: When activated, this mode helps enhance fuel economy on trips that involve frequent braking and acceleration.
  3. PWR Mode: When activated, Power mode optimizes acceleration feel by increasing the power output more quickly at the beginning of accelerator pedal operation.
Hybrid Vehicle (HV) Battery Pack

The Prius V features a high voltage Hybrid Vehicle (HV) battery pack that contains sealed Nickel Metal Hydride (NiMH) battery modules.

HV Battery Pack
- The HV battery assembly is enclosed in a metal case and is rigidly mounted to the cross member in the cargo area behind the rear seat. The metal case is isolated from high voltage and concealed by a carpeted panel in the cabin area.
- The HV battery pack consists of 28 low voltage (7.2 Volt) NiMH battery modules connected in series to produce approximately 201.6 Volts. Each NiMH battery module is non-spillable and in a sealed case.
- The electrolyte used in the NiMH battery module is an alkaline mixture of potassium and sodium hydroxide. The electrolyte is absorbed into the battery cell plates and will not normally leak, even in a collision.

HV Battery Pack Recycling
- The HV battery pack is recyclable. Contact the nearest Toyota dealer or:
  - United States: (800) 331-4331
  - Canada: (888) TOYOTA 8 [(888) 869-6828]
27 Volt System

The Prius V is equipped with a 27 Volt AC assist motor for the Electric Power Steering (EPS) system. The EPS computer generates 27 Volts from the 12 Volt system. The 27 Volt wires are isolated from the metal chassis and routed a short distance from the EPS computer to the EPS assist motor in the steering column.

NOTE:
27 Volts AC has a higher arc potential than 12 Volts DC.
Low Voltage Battery

**Auxiliary Battery**
- The Prius V contains a sealed lead-acid 12 Volt battery. The 12 Volt auxiliary battery powers the vehicle’s electrical system similar to a conventional vehicle. As with conventional vehicles, the negative terminal of the auxiliary battery is grounded to the metal chassis of the vehicle.
- The auxiliary battery is located in the cargo area. It is concealed by a fabric cover on the passenger side in the rear quarter panel well.

**NOTE:**
An under hood label shows the location of the HV battery (traction battery) and 12 Volt auxiliary battery.
High Voltage Safety

The HV battery pack powers the high voltage electrical system with DC electricity. Positive and negative orange colored high voltage power cables are routed from the battery pack, under the vehicle floor pan, to the inverter/converter. The inverter/converter contains a circuit that boosts the HV battery voltage from 201.6 to 650 Volts DC. The inverter/converter creates 3-phase AC to power the motor. Power cables are routed from the inverter/converter to each high voltage motor (electric motor, electric generator, and A/C compressor). The following systems are intended to help keep occupants in the vehicle and emergency responders safe from high voltage electricity:

High Voltage Safety System

- A high voltage fuse ① provides short circuit protection in the HV battery pack.

- Positive and negative high voltage power cables ② connected to the HV battery pack are controlled by 12 Volt normally open relays ③. When the vehicle is shut off, the relays stop electrical flow from leaving the HV battery pack.

**WARNING:**
The high voltage system may remain powered for up to 10 minutes after the vehicle is shut off or disabled. To prevent serious injury or death from severe burns or electric shock, avoid touching, cutting, or breaching any orange high voltage power cable or high voltage component.

- Both positive and negative power cables ④ are insulated from the metal body. High voltage electricity flows through these cables and not through the metal vehicle body. The metal vehicle body is safe to touch because it is insulated from high voltage components.

- A ground fault monitor ⑤ continuously monitors for high voltage leakage to the metal chassis while the vehicle is running. If a malfunction is detected, the hybrid vehicle computer ⑥ will illuminate the master warning light in the instrument cluster and indicate “Check Hybrid System” on the multi-information display.
SRS Airbags & Seat Belt Pretensioners

Standard Equipment
- Electronic frontal impact sensors (2) are mounted in the engine compartment 1 as illustrated.
- Front seat belt pretensioners are mounted near the base of the B-pillars 2.
- A frontal dual stage driver airbag 3 is mounted in the steering wheel hub.
- A frontal twin-chamber shaped dual stage passenger airbag 4 is integrated into the dashboard and deploys through the top of the dashboard.
- The SRS computer 5, which contains an impact sensor, is mounted on the floor pan underneath the instrument panel.
- Front electronic side impact sensors (2) are mounted near the base of the B-pillars.
- Rear electronic side impact sensors (2) are mounted near the base of the C-pillars.
- Front seat side airbags 6 are mounted in the front seatbacks.
- Side curtain airbags 7 are mounted along the outer edge inside the roof rails.
- A driver knee airbag 8 is mounted on the lower portion of the dash.
- Front door electronic side impact sensors (2) are mounted inside the base of the front doors.

Optional Equipment
- The optional pre-collision safety system contains a radar sensory system, occupant seat sensor, and an electric motor-pyrotechnic pretensioner system. During a pre-collision event, an electric motor in the pretensioners retracts the front seatbelts. When conditions stabilize the electric motor will reverse itself. When the airbags deploy, or as necessary, the pyrotechnic pretensioners function normally.

WARNING:
The SRS may remain powered for up to 90 seconds after the vehicle is shut off or disabled. To prevent serious injury or death from unintentional SRS deployment, avoid breaching the SRS components.
SRS Airbags & Seat Belt Pretensioners (Continued)

NOTE:
The front seatback mounted side airbags and the side curtain airbags may deploy independently of each other.

The knee airbag is designed to deploy simultaneously with the frontal airbag.

The Prius V is equipped with a standard front passenger occupant classification system that may prohibit the deployment of the front passenger frontal airbag, seatback mounted side airbag, and seat belt pretensioner. If the passenger occupant classification system prohibits deployment during an SRS event, the passenger SRS will not re-arm nor deploy.

Electronic side impact sensors are installed in each front door to aid in side collision detection accuracy.
Emergency Response

On arrival, emergency responders should follow their standard operating procedures for vehicle incidents. Emergencies involving the Prius V may be handled like other automobiles except as noted in these guidelines for Extrication, Fire, Overhaul, Recovery, Spills, First Aid, and Submersion.

⚠️ WARNING:
- *Never* assume the Prius V is shut off simply because it is silent.
- Always observe the instrument cluster for the READY indicator status to verify whether the vehicle is on or shut off. The vehicle is shut off when the READY indicator is off.
- Failure to shut off and disable the vehicle before emergency response procedures are performed may result in serious injury or death from the unintentional deployment of the SRS or severe burns and electric shock from the high voltage electrical system.

Extrication
- Immobilize Vehicle
  - Chock wheels and set the parking brake.
  - Push the P switch to engage park (P).

- Disable Vehicle
  - Performing either of the following two procedures will shut the vehicle off and disable the HV battery pack, SRS, and gasoline fuel pump.

<table>
<thead>
<tr>
<th>Chock Wheels</th>
<th>Set Parking Brake</th>
</tr>
</thead>
<tbody>
<tr>
<td>Push P Switch</td>
<td></td>
</tr>
</tbody>
</table>
Emergency Response (Continued)

Extrication (Continued)

Procedure #1
1. Confirm the status of the READY indicator in the instrument cluster.
2. If the READY indicator is illuminated, the vehicle is on and operational. Shut off the vehicle by pushing the power button once.
3. The vehicle is already shut off if the instrument cluster lights and the READY indicator are not illuminated. Do not push the power button because the vehicle may start.
4. If the smart key is easily accessible, keep it at least 16 feet (5 meters) away from the vehicle.
5. If the smart key cannot be found, disconnect the 12 Volt auxiliary battery behind the cover in the cargo area to prevent accidental restarting of the vehicle.
Extrication (Continued)

Procedure #2 (Alternate if power button is inaccessible)
1. Open the hood.
2. Remove the fuse box cover.
3. Remove the IG2 fuse (20A yellow colored) in the engine compartment fuse box (refer to illustration). If the correct fuse cannot be recognized, pull all fuses in the fuse box.
4. Disconnect the 12 Volt auxiliary battery under the cover in the cargo area.

NOTE:
Before disconnecting the 12 Volt auxiliary battery, if necessary, lower the windows, unlock the doors and open the back door as required. Once the 12 Volt auxiliary battery is disconnected, power controls will not operate.

⚠️ WARNING:
- The high voltage system may remain powered for up to 10 minutes after the vehicle is shut off or disabled. To prevent serious injury or death from severe burns or electric shock, avoid touching, cutting, or breaching any orange high voltage power cable or high voltage component.
- The SRS may remain powered for up to 90 seconds after the vehicle is shut off or disabled. To prevent serious injury or death from unintentional SRS deployment, avoid breaching the SRS components.
- If none of the disabling procedures can be performed, proceed with caution as there is no assurance that the high voltage electrical system, SRS, or fuel pump are disabled.
Emergency Response (Continued)

Extrication (Continued)

- **Stabilize Vehicle**
  - Crib at (4) points directly under the front and rear pillars.
  - Do not place cribbing under the high voltage power cables, exhaust system, or fuel system.

  **NOTE:**
  The Prius V is equipped with a tire pressure warning system that by design prevents pulling the metal valve stem with integral transmitter from the wheel. Snapping the valve stem with pliers or removing the valve cap and Schrader valve will release the air in the tire.

- **Access Patients**
  - **Glass Removal**
    - Use normal glass removal procedures as required.

  **SRS Awareness**
  - Responders need to be cautious when working in close proximity to undeployed airbags and seat belt pretensioners. Front dual stage airbags automatically ignite both stages within a fraction of a second.

  **Door Removal/Displacement**
  - Doors can be removed by conventional rescue tools such as hand, electric, and hydraulic tools. In certain situations, it may be easier to pry back the vehicle body to expose and unbolt the hinges.

  **NOTE:**
  To prevent accidental airbag deployment when performing front door removal/displacement, ensure the vehicle is shut off and the 12 Volt auxiliary battery is disconnected.
Emergency Response (Continued)

Extrication (Continued)

Roof Removal

The Prius V is equipped with side curtain airbags. When undeployed, total roof removal is not recommended. Patient access through the roof can be performed by cutting the roof center section inboard of the roof rails as illustrated. This would avoid breaching the side curtain airbags, inflators, and wiring harness.

NOTE:
The side curtain airbags may be identified as illustrated on this page (additional component details on page 16).

An optional transparent dark gray polycarbonate roof panel is available for the Prius V. When cutting the roof center section, use appropriate cutting tools for polycarbonate.

Dash Displacement

The Prius V is equipped with side curtain airbags. When undeployed, total roof removal is not recommended to avoid breaching the side curtain airbags, inflators, and wiring harness. As an alternative, dash displacement may be performed by using a Modified Dash Roll.
**Emergency Response (Continued)**

**Extrication (Continued)**

Rescue Lift Air Bags

Responders should not place cribbing or rescue lift air bags under the high voltage power cables, exhaust system, or fuel system.

Repositioning Steering Wheel and Front and Rear Seats

Telescopic steering wheel and seat controls are shown in the illustrations.

NOTE:
The Prius V is equipped with an optional electrochromic auto dimming rear view mirror. The mirror contains a minimal amount of transparent gel sealed between two glass plates that will not normally leak.
Emergency Response (Continued)

Fire
Approach and extinguish a fire using proper vehicle fire fighting practices as recommended by NFPA, IFSTA, or the National Fire Academy (USA).

- Extinguishing Agent
  Water has been proven to be a suitable extinguishing agent.

- Initial Fire Attack
  Perform a fast, aggressive fire attack. Divert the runoff from entering watershed areas.
  Attack teams may not be able to identify a Prius V until the fire has been knocked down and overhaul operations have commenced.

- Fire in the HV Battery Pack
  Should a fire occur in the NiMH HV battery pack, attack crews should utilize a water stream or fog pattern to extinguish any fire within the vehicle except for the HV battery pack.

⚠️ WARNING:
- The NiMH battery electrolyte is a caustic alkaline (pH 13.5) that is damaging to human tissues. To avoid injury by coming in contact with the electrolyte, wear proper personal protective equipment.
- The battery modules are contained within a metal case and accessibility is limited.
- To avoid serious injury or death from severe burns or electric shock, never breach or remove the high voltage battery pack cover under any circumstance including fire.

When allowed to burn themselves out, the Prius V NiMH battery modules burn rapidly and can quickly be reduced to ashes except for the metal.

Offensive Fire Attack
Normally, flooding an NiMH HV battery pack with copious amounts of water at a safe distance will effectively control the HV battery pack fire by cooling the adjacent NiMH battery modules to a point below their ignition temperature. The remaining modules on fire, if not extinguished by the water, will burn themselves out.

However, flooding the Prius V HV battery pack is not recommended due to the battery case design and location preventing the responder from properly applying water through the available vent openings safely. Therefore, it is recommended that the incident commander allow the Prius V HV battery pack to burn itself out.

Defensive Fire Attack
If the decision has been made to fight the fire using a defensive attack, the fire attack crew should pull back a safe distance and allow the NiMH battery modules to burn themselves out. During this defensive operation, fire crews may utilize a water stream or fog pattern to protect exposures or to control the path of smoke.
Emergency Response (Continued)

Overhaul
During overhaul, immobilize and disable the vehicle if not already done. Refer to illustrations on page 18, 19 and 20. The HV battery cover should never be breached or removed under any circumstances including fire. Doing so may result in severe electrical burns, shock, or electrocution.

- Immobilize Vehicle
  Chock wheels and set the parking brake.
  Push the P switch to engage park (P).

- Disable Vehicle
  Performing either of the following two procedures will shut the vehicle off and disable the HV battery pack, SRS, and gasoline fuel pump.

Procedure #1
1. Confirm the status of the READY indicator in the instrument cluster.
2. If the READY indicator is illuminated, the vehicle is on and operational. Shut off the vehicle by pushing the power button once.
3. The vehicle is already shut off if the instrument cluster lights and the READY indicator are not illuminated. Do not push the power button because the vehicle may start.
4. If the smart key is easily accessible, keep it at least 16 feet (5 meters) away from the vehicle.
5. If the smart key cannot be found, disconnect the 12 Volt auxiliary battery behind the cover in the cargo area to prevent accidental restarting of the vehicle.

Procedure #2 (Alternate if power button is inaccessible)
1. Open the hood and remove the fuse box cover.
2. Remove the IG2 fuse (20A yellow colored) in the engine compartment fuse box as illustrated on page 21. If the correct fuse cannot be recognized, pull all fuses in the fuse box.
3. Disconnect the 12 Volt auxiliary battery under the cover in the cargo area.

NOTE:
Before disconnecting the 12 Volt auxiliary battery, if necessary, lower the windows, unlock the doors and open the back door as required. Once the 12 Volt auxiliary battery is disconnected, power controls will not operate.

⚠️ WARNING:
- The high voltage system may remain powered for up to 10 minutes after the vehicle is shut off or disabled. To prevent serious injury or death from severe burns or electric shock, avoid touching, cutting, or breaching any orange high voltage power cable or high voltage component.
- The SRS may remain powered for up to 90 seconds after the vehicle is shut off or disabled. To prevent serious injury or death from unintentional SRS deployment, avoid breaching the SRS components.
- If none of the disabling procedures can be performed, proceed with caution as there is no assurance that the high voltage electrical system, SRS, or fuel pump are disabled.

Recovering/Recycling of NiMH HV Battery Pack
Clean up of the HV battery pack can be accomplished by the vehicle recovery crew without further concern of runoff or spillage. For information regarding recycling of the HV battery pack, contact the nearest Toyota dealer, or:

United States: (800) 331-4331
Canada: (888) TOYOTA 8 [(888) 869-6828]
Emergency Response (Continued)

Spills
The Prius V contains the same common automotive fluids used in other non-hybrid Toyota vehicles, with the exception of the NiMH electrolyte used in the HV battery pack. The NiMH battery electrolyte is a caustic alkaline (pH 13.5) that is damaging to human tissues. The electrolyte, however, is absorbed in the cell plates and will not normally spill or leak out even if a battery module is cracked. A catastrophic crash that would breach both the metal battery pack case and a battery module would be a rare occurrence.

Similar to the use of baking soda to neutralize a lead-acid battery electrolyte spill, a dilute boric acid solution or vinegar can be used to neutralize a NiMH battery electrolyte spill.

NOTE:
Electrolyte leakage from the HV battery pack is unlikely due to its construction and the amount of available electrolyte contained within the NiMH modules. Any spillage would not warrant a declaration as a hazardous material incident. Responders should follow the recommendations as outlined in this emergency response guide.

In an emergency, the NiMH battery part number G9280-47170 manufacturer’s Material Safety Data Sheet (MSDS) is available by contacting:

United States: CHEMTREC at (800) 424-9300
Canada: CANUTEC at *666 or (613) 996-6666 (collect)

- Handle NiMH electrolyte spills using the following Personal Protective Equipment (PPE):
  - Splash shield or safety goggles. Fold down helmet shields are not acceptable for acid or electrolyte spills.
  - Rubber, latex or nitrile gloves.
  - Apron suitable for alkaline.
  - Rubber boots.

- Neutralize NiMH Electrolyte
  - Use a boric acid solution or vinegar.
  - Boric acid solution - 800 grams boric acid to 20 liters water or 5.5 ounces boric acid to 1 gallon of water.

First Aid
Emergency responders may not be familiar with a NiMH electrolyte exposure when rendering aid to a patient. Exposure to the electrolyte is unlikely except in a catastrophic crash or through improper handling. Utilize the following guidelines in the event of exposure.

⚠️ WARNING:
The NiMH battery electrolyte is a caustic alkaline (pH 13.5) that is damaging to human tissues. To avoid injury by coming in contact with the electrolyte, wear proper personal protective equipment.

- Wear Personal Protective Equipment (PPE)
  - Splash shield or safety goggles. Fold down helmet shields are not acceptable for acid or electrolyte spills.
  - Rubber, latex or nitrile gloves.
  - Apron suitable for alkaline.
  - Rubber boots.

- Absorption
  - Perform gross decontamination by removing affected clothing and properly disposing of the garments.
  - Rinse the affected areas with water for 20 minutes.
  - Transport patients to the nearest emergency medical care facility.

- Inhalation in Non-Fire Situations
  - No toxic gases are emitted under normal conditions.

- Inhalation in Fire Situations
  - Toxic gases are given off as by-products of combustion. All responders in the Hot Zone should wear the proper PPE for fire fighting including SCBA.
  - Move a patient from the hazardous environment to a safe area and administer oxygen.
  - Transport patients to the nearest emergency medical care facility.
Emergency Response (Continued)

First Aid (Continued)

- Ingestion
  Do not induce vomiting.
  Allow the patient to drink large quantities of water to dilute the electrolyte (never give water to an unconscious person).
  If vomiting occurs spontaneously, keep the patient’s head lowered and forward to reduce the risk of asphyxiation.
  Transport patients to the nearest emergency medical care facility.

Submersion
A submerged hybrid vehicle does not have high voltage potential on the metal vehicle body, and is safe to touch.

Access Patients
Responders can access the patient and perform normal extrication procedures. High voltage orange color coded power cables and high voltage components should never be touched, cut, or breached.

Vehicle Recovery
If a hybrid vehicle is fully or partially submerged in water, emergency responders may not be able to determine if the vehicle has been automatically disabled. The Prius V may be handled by following these recommendations:

1. Remove the vehicle from the water.
2. Drain the water from the vehicle if possible.
3. Follow the immobilizing and disabling procedures on page 18, 19 and 20.

NOTE:
If park (P) system related components are damaged due to submersion, it may not be possible to shift from park (P) to neutral (N). If this is the case, make sure to tow or move the vehicle with the front wheels off the ground.
Roadside Assistance

The Prius V utilizes an electronic shift selector and a P switch for selecting park (P). If the 12 Volt auxiliary battery is discharged or disconnected, the vehicle cannot be started nor can it be shifted out of park (P). If discharged, the 12 Volt auxiliary battery can be jump started to allow vehicle starting and shifting out of park (P). Most other roadside assistance operations may be handled like conventional Toyota vehicles.

Toyota Roadside Assistance is available by contacting:

United States: (800) 297-0486 (for the first 2 years/25,000 miles)
Canada: (888) TOYOTA 8 [(888) 869-6828] (for the first 3 years/60,000 km)

Towing

The Prius V is a front wheel drive vehicle and it must be towed with the front wheels off the ground. Failure to do so may cause serious damage to Hybrid Synergy Drive components.

- The vehicle may be shifted out of park (P) into neutral (N) when in either the ignition-on or READY-on mode. To select neutral (N), it is necessary to hold the shift selector in the N position for approximately 0.5 seconds.

- If the 12 Volt auxiliary battery is discharged, the vehicle will not start and shifting out of park (P) is not possible. There is no manual override except to jump start the vehicle, refer to Jump Starting on page 31.

- If a tow truck is not available, in an emergency the vehicle may be moved using a cable or chain secured to the emergency towing eyelet or rear tow hook for short distances at low speeds (below 18 mph (30km/h)). The eyelet is located with the tools in the cargo area of the vehicle, refer to the illustration on page 30.
**Roadside Assistance (Continued)**

**Electric Back Door Opener**
The Prius V is equipped with an electric back door opener. In the event of 12 Volt power loss, the back door cannot be opened from the outside of the vehicle.

The electric back door can be opened manually using the release as shown in the illustration.
Roadside Assistance (Continued)

**Spare Tire**
The jack, tools, towing eyelet and spare tire are provided as shown.
Roadside Assistance (Continued)

Jump Starting
The 12 Volt auxiliary battery may be jump started if the vehicle does not start and the instrument cluster gauges are dim or off after depressing the brake pedal and pushing the power button.

The 12 Volt auxiliary battery is located in the cargo area. If the 12 Volt auxiliary battery is discharged, the back door cannot be opened. Instead, the vehicle can be jump started by accessing the remote positive 12 Volt auxiliary battery terminal in the engine compartment fuse box.

- Remove the fuse box cover, and open the positive terminal cover.
- Connect the positive jumper cable to the positive terminal.
- Connect the negative jumper cable to a solid ground.
- Place the smart key in proximity to the interior of the vehicle, depress the brake pedal, and push the power button.

NOTE: If the vehicle does not recognize the smart key after connecting the booster battery to the vehicle, open and close the driver door when the vehicle is shut off.

If the smart key internal battery is dead, touch the Toyota emblem side of the smart key to the power button during the start sequence. Refer to the instructions and illustrations on page 9 for more details.

- The high voltage HV battery pack cannot be jump started.

Immobilizer
The Prius V is equipped with a standard immobilizer system.

- The vehicle can be started only with a registered smart key.
